AQUATIC ORGANISM PASSAGE AT ROAD-STREAM CROSSINGS

THE PROBLEM: Poorly designed crossings can prohibit aquatic organism passage in a stream network.

Undersized Crossings

Shallow Crossings

Perched Crossings

GOAL: LET THE STREAM ACT LIKE A STREAM. MAKE THE ROAD INVISIBLE TO THE STREAM.

GOOD CROSSINGS:

- 1. Span the stream and its banks
- 2. Match the elevation and slope of the stream
- 3. Have natural substrate throughout the crossing
